Developer Notes - Tide - JS Functionality

===

The goal of this doc is to summarize the steps and details needed to build the functionality required for the Tide Website.

Concept: A select menu to choose information coming from an array.

Synopsis: This is where the user can discover a bit more about Tide. By clicking on the modes, they will find out how to properly use Tide when it is launched. The user should be able to open it both on mobile and on desktop.

Steps:
1. Set up html markup;
2. Set order of what should come first: array information, then interactivity;
3. Work 1 thing at a time;
4. When selected, the container should demonstrate information about the desired washing state;
5. Set up array;
6. Set up variables, datasets, functions and event handlers;
7. Debug functionality;
8. Fix CSS/JS;

Considerations:
- Keep it simple, if you're having difficulty with something, go do another thing, then go back. Ask questions to Trevor, too.
- Focus on the basics of JS and do not overthink.
